Cafy Agent — Changes Summary

Résumé generation · Job matching & pipeline · Email integration · 7 Nov 2026

1. Résumé — UK template & tailoring

- **Layout matches the UK template** in every output (PDF preview, PDF/DOCX/LaTeX download): bold centred name, role, phone | email | location; a rule before each section; entries as *Organisation, Location* | *dates* then the bold role.
- **Exactly 5 sections:** About Me, Education, Work Experience (full-time + internships), Projects, Skills (3 columns). Certifications/publications/achievements stay in the data but are not printed or shown in the editor.
- **Fixed:** name overlapping the role line in the PDF header.
- **Tailored per selected job, automatically:** no review step and no dead end if the AI is unavailable (rule-based fallback, labelled *tailoring_mode*). About Me is written for that job from real facts only.
- **No fake content:** a job keyword is added to Skills only when its exact wording is on the résumé; education, employers and dates are copied unchanged; essential skills the résumé lacks are reported, never added. Most job-relevant bullets and projects are moved first.
- **Skills parsing:** headings like "Core Skills", "Skills & Tools", "IT Skills" are now recognised; wrapped lines, brackets and versions are handled (e.g. TCP/IP, Windows Server).

2. Job pipeline & matching

- **Upload speed:** matching cut from ~3–4 min to ~1–2 s for 2,833 jobs (regex pre-checks + caching); verified identical results.
- **New scoring (requirement-coverage-v1):** requirements are read from each job description as *essential* (Essential / Requirements / About you…) or *desirable* (Desirable / Nice to have / Preferred…). Each is graded against the whole résumé: direct (used in a role/project) 1.0, listed only 0.5, related tool 0.4, missing 0. Essential counts 2× desirable. Score = earned ÷ possible.
- **No false requirements:** a skill counts only if the ad names it ("machine" is not Machining, "value" is not Valuation). Soft skills (e.g. Communication) are listed but not scored.
- **Explainable:** the API returns a full breakdown per job (checks, each requirement, the exact résumé line as evidence); it is not yet shown on a reachable screen. Weights are configurable (*CAFY_MATCH_CONFIG*, */api/matching/config*) and can be calibrated with *backend/scripts/calibrate_matching.py*.
- **Find Jobs UI:** filters open only when "Filters" is clicked; Remove résumé button is in the list toolbar.

3. Conditions for a job to be listed

Rule	Requirement
Experience level	Fresher vs experienced from dated full-time roles (internships never count as years). A fresher never sees roles for experienced hires, and vice versa. Stated years must be met.
Score	85% or more (the only listing threshold: uploads, refresh, chat, email alerts).
Skills	4 or more of the job's skills matched on the résumé.
Qualifications	Every essential qualification met (degree level, or named ones such as ACCA, CIPD, PRINCE2). "Or equivalent experience" is honoured.
Not scored	Right to work, security clearance, driving licence, DBS — shown as "check before applying". UK visa sponsorship is assessed separately.

Note: on the current 2,833 scraped jobs (mostly AI/tech roles) the four test résumés reach no 85% match under these rules — an empty list there is an honest result, not an error.

4. Email integration

- **Fixed:** Gmail/Outlook connected through **Nango** was never read (only the app's own OAuth accounts were synced). Nango mailboxes are now linked to the email agent automatically when the Email page opens.
- Tokens come from Nango on every sync (Nango refreshes them); none are stored by Cafy. Disconnecting stops reading without revoking Nango's token.
- First sync reads the last 14 days in the background; new mail is picked up every 5 minutes (*EMAIL_AGENT_POLL_MINUTES*) or via "Sync now". Errors are shown on the account, not hidden.
- Gmail address lookup falls back to the Gmail profile API when the connection has no OpenID scope.

5. Run & test with uv (not pip)

```
uv sync                # install from uv.lock
uv run backend/run.py  # API on :8000
npm --prefix frontend run dev
uv run pytest backend/tests
uv add <package>       # never pip install
```

Tests: frontend 88/88 pass. Backend: 464 passed, 2 failed — both database resume-version tests that also fail on the last commit (unrelated). Restart the backend to load the new code.
